

Evaluate performance enhancements in a system after introducing DevOps practices.
Create a modular DevOps framework for continuous delivery in a banking application.
Formulate an ecosystem incorporating tools, practices, and policies for enterprise DevOps transformation.
Contrast DevOps lifecycle with traditional release cycles across infrastructure and testing phases.
Design a secure and scalable DevOps pipeline integrating containerization and orchestration tools.
Synthesize strategies to align DevOps with environmental sustainability in IT operations.
Recommend role-specific responsibilities within a multidisciplinary DevOps implementation team.

Build a version control structure for a distributed DevOps team with branching logic.
Critique pipeline failures in CI/CD systems and trace root causes with examples.
Compare stateless vs stateful containerized deployments in production systems.
Design a continuous testing strategy using multiple testing frameworks.
Evaluate resource consumption patterns from continuous monitoring dashboards.
Compose a tool pipeline integrating SCM, CI, CT, CD, containerization, and monitoring.
Recommend policies to secure configuration files and prevent unauthorized modifications.

Construct a branching and merging strategy using Git for a multi-developer project.
Evaluate the pros and cons of CVCS and DVCS architectures for enterprise applications.
Recommend a suitable Git workflow for a fast-paced startup environment with justification.
Create a comparison report between Git, Mercurial, and CVS based on key DevOps requirements.
Create a quick reference guide for beginners to effectively use Git repositories and manage branches.
Interpret error messages from Git CLI and propose resolution strategies for each.
Formulate a migration plan to switch from CVS to Git in a legacy enterprise system.

Build a CI/CD pipeline using Jenkins for a multi-module application including GitHub integration.
Evaluate Jenkins capabilities in reducing integration errors during parallel development.
Compose a plan to automate test and deployment jobs using Jenkins pipeline DSL and cron triggers.
Compare Jenkins with other CI tools in terms of plugin ecosystem, scalability, and security.
Formulate a troubleshooting guide for failed builds in a CI/CD pipeline involving Git and Jenkins.
Justify the role of CI/CD in increasing developer productivity and product stability.
Design a Jenkinsfile script supporting branching strategies and conditional build triggers.

Construct a Dockerfile for deploying a multi-tier web application using custom base images.
Evaluate Docker's role in simplifying software delivery across different environments.
Design a scalable container-based architecture for microservice-based application deployment.
Analyze resource isolation in containers using Linux namespaces and cgroups.
Compare Docker with legacy deployment methods using parameters like overhead, portability, and setup.
Develop a stepwise deployment plan for running Java services inside Docker containers.
Recommend a container management solution for automating lifecycle operations across OS variants.

Design a test automation framework using Selenium for a multi-form web application.
Evaluate the effectiveness of configuration management tools in reducing deployment risks.
Create a testing life cycle model incorporating automation tools for continuous feedback.
Analyze the provisioning pipeline using Chef in a scalable multi-node deployment environment.
Recommend a toolchain combining testing, provisioning, and configuration management in DevOps.
Build a configuration-as-code setup using Ansible to provision a LAMP stack for production deployment.
Justify the transition from traditional configuration scripting to tool-based provisioning models.
