

WAIR ISE-1 SOLUTION

1. Define Web Analytics. Mention two key metrics used in analyzing website performance.

- Web Analytics is the process of collecting and analyzing website data to understand how users interact with the site.
 - It helps in measuring website performance and identifying areas for improvement.
 - It enables businesses to make data-driven decisions to increase traffic, user engagement, and conversions.
 - **Two key metrics:**
 - **Bounce Rate** – Measures how many users leave the site without engaging. *(e.g., 70% bounce rate = 70 out of 100 left without clicking anything).*
 - **Average Session Duration** – Indicates how long users stay on the website on average. *(e.g., 2 minutes/session suggests moderate engagement).*
-

2. What is meant by user behaviour in web analytics?

- User behaviour refers to the actions taken by visitors while browsing a website.
 - It includes metrics like clicks, scrolling, time spent, navigation paths, and interactions.
 - Understanding user behaviour helps improve the user experience and website content.
 - Example: If users spend more time on product pages but leave without buying, it may suggest pricing or checkout issues.
-

3. List components of an Information Retrieval (IR) system.

- **Document Collection** – Stores all the text, files, or data to be searched. *(e.g., a library of news articles).*
 - **Indexing System** – Converts documents into searchable formats using keywords or tokens.
 - **Query Processor** – Interprets user queries and finds matching documents. *(e.g., Google search box).*
 - **Ranking Algorithm** – Orders results by relevance to the user's query, showing the best matches first.
-

4. Explain the term “clickstream data” in web analytics.

- Clickstream data is the path or sequence of clicks a user makes while visiting a website.
 - It includes details like pages visited, time spent on each page, and actions taken.
 - This data helps identify popular paths, user interests, and site navigation issues.
 - Example: A clickstream showing most users drop off at the payment page may highlight a checkout problem.
-

5. Compare indexing and querying in IR systems.

Indexing	Querying
Organizes and processes documents to make them searchable.	Takes user input and retrieves matching documents.
Performed during the setup or update phase.	Happens at the time of user search.
Improves speed and accuracy of information retrieval.	Helps users find relevant results quickly.
Example: Creating a keyword map of documents.	Example: Searching “machine learning” in a digital library.

6. Write practical applications of Information Retrieval in IT.

- **Search Engines:** Used to fetch relevant web pages for user queries. (*e.g., Google, Bing*).
 - **E-Commerce Search:** Helps users find products using keywords or filters. (*e.g., searching “red shoes” on Amazon*).
 - **Digital Libraries:** Enables researchers to find academic papers or books. (*e.g., IEEE Xplore, JSTOR*).
 - **Recommendation Systems:** Suggests content based on user interests and past behavior. (*e.g., Netflix movie suggestions*).
-

7. The purpose of KPIs in web analytics?

- KPIs (Key Performance Indicators) are measurable values that show how effectively a business meets objectives.
- They help track progress toward goals such as increased sales, better user retention, or higher engagement.
- KPIs focus on strategic outcomes, not just raw data.
- Example: A KPI could be "Reduce bounce rate to under 50% in 2 months" — which is specific and measurable.

8. The key differences between metrics and KPIs with examples.

Metrics	KPIs
Raw data points collected from the website.	Target-oriented performance indicators.
Help understand general activity.	Help track goal achievement.
Example: Page Views, Session Duration.	Example: Lead Conversion Rate = Goal-specific metric.
Metrics can be many; KPIs are few and focused.	KPIs are selected from relevant metrics for decision-making.

9. List any 8 common web metrics used in website performance analysis.

(Each with a brief purpose)

- **Page Views** – Number of times a page is loaded; indicates content popularity.
- **Bounce Rate** – % of users who leave after one page; indicates engagement issues.
- **Session Duration** – Average time users spend; helps assess interest levels.
- **Click-Through Rate (CTR)** – % of users who click on links; shows campaign effectiveness.
- **Conversion Rate** – % of users who complete goals (like purchases); shows ROI.
- **Exit Rate** – % of users who leave from a specific page; shows weak spots.
- **New vs. Returning Visitors** – Tracks user loyalty and repeat visits.
- **Traffic Source** – Identifies where users are coming from (e.g., Google, ads, social media).

10. Bounce rate? How is it calculated in web analytics?

- Bounce rate measures the percentage of users who leave a site after viewing only one page.
- It indicates poor engagement or mismatch between user expectations and content.
- A high bounce rate may mean unclear navigation, slow loading, or irrelevant content.
- **Formula:** $\text{Bounce Rate} = (\text{Single-Page Visits} / \text{Total Visits}) \times 100$
 - *Example: 400 bounces out of 1000 sessions = 40% bounce rate.*

11. Compare cookies and JavaScript tags in user tracking.

Cookies	JavaScript Tags
Small files stored in the user's browser to remember preferences or sessions.	Code snippets added to web pages to collect user interaction data.
Track repeat visits and login sessions.	Track real-time actions like clicks, scrolls, and form submits.
Can be deleted or blocked by users.	Works dynamically and can collect data even on first visit.
Example: Remembering items in cart.	Example: Tracking which button was clicked on homepage.

12. Name any two popular web analytics tools and state one feature of each.

- **Google Analytics:** Offers real-time traffic monitoring and user behavior tracking. *(e.g., how many people are on your site right now).*
- **Matomo:** Open-source tool offering full data ownership and strong privacy features. *(Ideal for GDPR compliance).*

13. State the importance of data visualization in dashboard reporting.

- Helps simplify large datasets into readable charts, graphs, and visuals.
- Makes it easier to identify patterns, trends, and anomalies in performance.

- Useful for making quick decisions without digging through raw numbers.
 - Example: A bar chart comparing bounce rate across pages can show which ones need improvement.
-

14. Identify advantages of using server logs over cookies for user tracking.

- Server logs collect backend data, which cannot be blocked or deleted by users.
 - Logs include IP, browser, time stamps — even from users who block JavaScript or cookies.
 - Work even without JavaScript enabled; more reliable for tech-savvy users.
 - Example: Useful in detecting bot traffic or security threats.
-

15. List applications of campaign analysis in digital marketing.

- **ROI Measurement:** Understand which campaigns are generating revenue.
 - **Audience Targeting:** Identify which audience segments respond best.
 - **Channel Effectiveness:** Measure performance across email, ads, social, etc.
 - **Optimization:** Make data-driven decisions to improve ads, content, and targeting.
-

16. Explain how JavaScript tags help in real-time data collection on websites.

- JS tags are embedded code snippets that track user actions as they happen.
 - They send data instantly to analytics platforms for live monitoring.
 - Helps in identifying which parts of a webpage get the most clicks or interaction.
 - Example: Tagging a "Buy Now" button to see how many users are clicking it during a sale.
-

Great! Let's continue with the **remaining questions**, starting with the ones suitable for **3-mark and 5-mark** answers. I'll maintain the same beginner-friendly style, expand key ideas, and include examples wherever possible.

17. Discuss how server logs and APIs are used as data sources in web analytics.

- **Server Logs:** These are automatic records of user activity on a website generated by the web server. They capture details like IP address, browser type, time of visit, and pages accessed.
Example: Helps track traffic spikes, errors, or unauthorized access.
- **APIs (Application Programming Interfaces):** APIs allow tools to collect and share web analytics data in real time. They help integrate third-party analytics platforms like Google Analytics into custom dashboards.
Example: Using Google Analytics API to fetch session data into a business report.
- **Comparison:** Logs provide backend data (raw and detailed), while APIs enable customized, real-time insights via programming.
- **Usefulness:** Together, they allow advanced tracking, automation, and flexibility in analyzing user behavior and website health.

18. Compare and contrast three retrieval models used in IR systems.

Model	Description	Strength	Limitation	Example
Boolean Model	Uses AND/OR/NOT logic to match documents to queries.	Simple to implement.	No ranking of results.	Searching "AI AND Robotics".
Vector Space Model	Documents and queries are represented as vectors. Uses cosine similarity to rank results.	Ranks based on relevance.	Needs preprocessing like stemming, stopword removal.	Searching "data mining" returns ranked list.
Probabilistic Model	Estimates the probability that a document is relevant to a query.	Incorporates uncertainty and feedback.	Complex to train and tune.	Personalized search with user history.

19. Analyze the impact of poor indexing on the performance of an IR system.

- **Slow Retrieval:** Without indexing, searches go through the entire dataset, making retrieval slow.
- **Irrelevant Results:** Poor indexing may ignore important keywords, leading to irrelevant outputs.

- **Increased Storage Load:** Inefficient indexing increases storage needs and hampers scalability.
 - **User Frustration:** Users leave if search results are slow or off-topic, affecting usability.
 - **Example:** A news site without proper indexing may fail to show relevant articles even if they exist.
-

20. Explain the role of document representation in effective information retrieval.

- **Keyword Extraction:** The way content is represented (like keywords, terms, metadata) impacts what is indexed.
 - **Vectorization:** Documents are often converted to vectors for comparison and ranking.
 - **Relevance Scoring:** Better representations lead to better similarity scoring and result ranking.
 - **Example:** Using TF-IDF (Term Frequency–Inverse Document Frequency) improves retrieval by identifying unique terms in each document.
 - **Efficiency:** Accurate representations reduce the size of search space and improve processing speed.
-

21. Reflect on the importance of digital marketing in shaping user behaviour analytics.

- **Targeted Campaigns:** Digital marketing strategies guide how users are funneled to a site, impacting behavior metrics like clicks and time spent.
 - **Personalization:** Based on analytics, marketers customize experiences for different user segments.
 - **Behavior Tracking:** Campaigns are monitored via bounce rate, CTR, conversions, helping marketers understand what works.
 - **Example:** An ad for “50% off shoes” may drive more clicks to product pages, increasing session duration and interaction.
 - **Feedback Loop:** Insights from analytics help marketers refine future campaigns for better results.
-

22. Provide an example scenario where ranking is essential for search engine accuracy.

- **Scenario:** A user searches “best budget smartphones under ₹15,000” on a shopping website.
 - **Importance of Ranking:** The system should rank phones based on relevance, user reviews, or specifications.
 - **Without Ranking:** The user might see irrelevant phones first, leading to confusion or exit.
 - **With Ranking:** Accurate results at the top increase user satisfaction and sales.
-

23. Analyze the interdependence between user behaviour analysis and SEO in the context of an e-commerce platform.

- **User Behaviour Insights:** Data like bounce rate, session duration, and click patterns help understand what users find valuable.
 - **SEO Decisions:** Based on this data, SEO teams adjust keywords, titles, and content placement to better match user intent.
 - **Conversion Optimization:** Behavior analytics helps identify where users drop off, allowing SEO to improve landing pages.
 - **Example:** If users bounce from a product page quickly, it might need faster loading or clearer CTAs.
 - **Cycle of Improvement:** SEO brings traffic, analytics studies behavior, insights refine SEO — creating a continuous loop.
-

24. Discuss the flow of data from web logs to user insight reporting in a typical web analytics setup.

- **1. Data Collection:** Web servers generate logs when users interact with the website (e.g., IP, timestamp, page accessed).
- **2. Data Aggregation:** Raw logs are gathered and organized into structured formats using ETL (Extract, Transform, Load) tools.
- **3. Data Processing:** The logs are cleaned and processed using tools like Google Analytics or Matomo to extract meaningful information.
- **4. Data Analysis:** Analysts use metrics like bounce rate, session duration, and path flow to interpret user behavior.

- **5. Reporting:** Insights are visualized in dashboards, showing trends like user drop-offs, peak traffic, or conversions.

Example: High exits from the payment page might prompt UX redesign.

25. Evaluate the effectiveness of retrieval models (Boolean, Vector Space, Probabilistic) in delivering relevant results for different search scenarios.

- **Boolean Model:** Useful for exact-match queries (e.g., "COVID AND India"), but lacks ranking or flexibility.
 - **Vector Space Model:** Assigns weight to terms, allowing partial matches and ranking. Ideal for relevance-based search (e.g., blog or article search).
 - **Probabilistic Model:** Calculates relevance probability. Suitable for dynamic content and personalized results (e.g., product recommendations).
 - **Context Fit:** Boolean works well for legal or technical databases; vector and probabilistic are better for web and commercial search.
 - **Effectiveness:** Combining models in hybrid approaches often improves accuracy in modern IR systems.
-

26. A company wants to evaluate the impact of a UI change on bounce rate and session duration. How can web analytics be used to measure this change?

- **Baseline Data:** Collect bounce rate and session duration data before the UI change.
 - **Post-Change Comparison:** Monitor the same metrics after deploying the new UI.
 - **Segment Analysis:** Compare new vs. returning users or desktop vs. mobile users to see differences.
 - **A/B Testing:** Show old UI to one group and new UI to another to directly compare results.
 - **Example:** If bounce rate drops from 60% to 35% and session duration increases from 1 min to 2.5 min, the UI change likely improved user engagement.
-

27. Explain various ways in which clickstream data can be interpreted to improve digital campaigns.

- **User Path Analysis:** Understand which pages users visit before converting or exiting.
- **Identify Drop-Off Points:** Find where users lose interest and optimize those pages.

- **Refining Targeting:** See which channels (ads, search, social) bring the best traffic and invest more there.
 - **Personalized Content:** Serve relevant ads or suggestions based on previous clicks.
 - **Example:** If most users visit the pricing page but don't buy, you may need clearer pricing or offers.
-

28. Explain how average session duration and bounce rate together give insights into user engagement quality.

- **Average Session Duration** shows how long users stay and engage with the content.
 - **Bounce Rate** tells how many leave without interaction.
 - **Combined Insight:**
 - **High Duration + Low Bounce:** Great engagement.
 - **Low Duration + High Bounce:** Content may not match expectations.
 - **Example:** A blog post with 4 min average time and 20% bounce indicates quality content.
-

29. Discuss the significance of dwell time and exit rate in measuring website performance. Support with real-life implications.

- **Dwell Time:** Time spent on a page before returning to search or exiting — higher implies valuable content.
 - **Exit Rate:** % of users who leave from a particular page — shows where users tend to stop.
 - **Performance Insight:** High dwell time + low exit = engaging page. High exit on key pages = issue.
 - **Real-Life Impact:**
 - A product page with low dwell and high exit may have poor design or unclear info.
 - A blog post with high dwell time boosts SEO and user satisfaction.
 - **Use Case:** Optimize high-exit pages by adding CTAs, recommendations, or faster loading.
-

30. Compare Google Analytics and Matomo in terms of user tracking and reporting capabilities.

Feature	Google Analytics	Matomo
Ownership	Google controls data	You control all data (self-hosted)
Tracking	Uses JavaScript tags and cookies; detailed user behavior tracking	Offers similar tracking; can also use server logs
Reporting	Offers real-time, customizable dashboards	Reports can be fully customized and privacy compliant
Privacy	Subject to Google's data policies	GDPR-friendly; open-source solution

- **Conclusion:** GA is easier to use and integrates well with other tools; Matomo is better for privacy and control.
-

31. Explain the process of collecting web data using cookies. Include its limitations.

- **Creation:** When a user visits a website, a small file (cookie) is stored in their browser.
 - **Tracking:** Cookies track session data like login status, items in cart, or browsing preferences.
 - **Persistent vs. Session Cookies:** Persistent stay after closing the browser; session cookies expire with the session.
 - **Limitations:**
 - Can be blocked or deleted by users.
 - Limited to single browser/device.
 - Privacy concerns (especially post-GDPR).
 - **Example:** If a user adds a product to cart, cookies help keep it saved for their next visit.
-

32. Reflect on how campaign performance monitoring helps in ROI improvement.

- **Tracks Spending Efficiency:** Shows how much is spent vs. how much revenue is generated.

- **Identifies Top Channels:** Helps shift focus to high-performing platforms (e.g., Instagram > Twitter).
 - **Improves Targeting:** Campaign insights reveal which audience segments convert best.
 - **Real-Time Adjustment:** You can stop or adjust underperforming campaigns immediately.
 - **Example:** If a Facebook ad yields a 10% conversion rate and Google only 2%, shift budget accordingly.
-

33. Describe how a user tracking dashboard is structured using web metrics.

- **Header Panel:** Shows key KPIs like Total Users, Sessions, Bounce Rate.
 - **Traffic Source Section:** Breaks down where visitors come from (e.g., Direct, Organic, Social).
 - **Engagement Metrics:** Displays average session duration, pages per session, exit rate.
 - **Conversion Funnel:** Shows steps users take to reach goals (e.g., Product View → Cart → Checkout).
 - **Visualization:** Uses graphs, tables, and pie charts to make data understandable at a glance.
-

34. Analyze a scenario where bounce rate is low, but conversion rate is also low. What insights can be drawn?

- **High Engagement, Low Action:** Users are exploring pages but not completing desired actions (like purchases or sign-ups).
- **Possible Reasons:**
 - Confusing CTAs (Call-to-Actions)
 - Complicated checkout or form process
 - Poor value proposition or unclear pricing
- **Insight:** Site content might be interesting, but not persuasive enough to convert.
- **Example:** Users may spend time on product pages but leave when they see high delivery charges.

- **Action Plan:** Improve CTA visibility, simplify processes, add trust signals like reviews or guarantees.
-

35. Discuss the role of cookies, JavaScript tags, and server logs in comprehensive data collection strategies.

- **Cookies:** Store small user data like login sessions, preferences, and shopping carts. Useful for recognizing repeat visitors.
 - **JavaScript Tags:** Track dynamic interactions (clicks, hovers, scrolls) and send real-time data to analytics platforms.
 - **Server Logs:** Backend logs that capture all user requests, even without JavaScript or cookies.
 - **Together:** Provide both frontend (user interaction) and backend (server response) data.
 - **Example:** A full strategy might use JS tags for behavior, cookies for session identity, and logs for error tracking.
-

36. Evaluate a multi-channel campaign using key metrics like page views, dwell time, and conversion rate.

- **Page Views:** Show which platform drives the most traffic (e.g., Email vs. Instagram).
 - **Dwell Time:** Indicates content engagement — high dwell = users find value.
 - **Conversion Rate:** The ultimate metric — shows which channel is most effective at achieving goals.
 - **Compare Channels:** Email might have fewer views but higher conversion; social may have high views but poor dwell time.
 - **Actionable Insight:** Invest more in high-converting channels and improve content where dwell time is low.
-

37. A company's dashboard shows a steady increase in page views but low session durations. Analyze this trend and recommend improvements.

- **Interpretation:** Traffic is growing, but users leave quickly — surface-level interest without engagement.
- **Possible Causes:**

- Misleading titles
 - Slow load times or weak design
 - Content not matching user intent
 - **Recommendations:**
 - Improve page speed
 - Rework content structure for clarity
 - Align SEO keywords with actual page value
 - **Example:** If blogs attract clicks via catchy titles but lack depth, users bounce early.
-

38. Explain the difference between macro and micro conversions and how they are tracked in tools like Google Analytics.

- **Macro Conversions** refer to the main goals of a website, such as purchases or sign-ups. These directly impact revenue or business growth.
 - **Micro Conversions** are smaller interactions like newsletter sign-ups, adding to wishlist, or spending time on a blog. These indicate user interest.
 - **Google Analytics Tracking:**
 - Macro conversions are tracked via Goals or e-commerce tracking.
 - Micro conversions are often tracked using custom Events or intermediate Goals.
 - **Example:** Watching a product video (micro) → adding to cart (micro) → making a purchase (macro).
-

39. Interpret a dashboard showing high bounce rate and high click-through rate for a blog post. What could this indicate?

- **High CTR** means users are finding the title or link attractive and clicking on it.
- **High Bounce Rate** indicates they leave quickly without engaging with the content.
- **Possible Reasons:**
 - Misleading or over-promised title (clickbait)
 - Poor page design or slow load time
 - Content doesn't meet expectations

- **Solution:** Align title with actual content, improve readability and user experience.
-

40. Explain the importance of dwell time and conversion funnel drop-off in campaign analysis.

- **Dwell Time** shows how long users spend on a page; higher dwell = better content engagement.
 - **Funnel Drop-Off** highlights the stage in the user journey where people abandon the goal.
 - **Together**, they help identify what's working and what needs improvement.
 - **Example:** High dwell on product page + drop-off at payment → maybe the checkout form is too long.
 - **Improvement:** Simplify user flow, reduce steps, or clarify pricing.
-

41. List 6 key metrics used to evaluate SEO performance.

1. **Organic Traffic:** Measures non-paid visitors from search engines; core SEO metric.
 2. **Bounce Rate:** Indicates whether users are finding content relevant or leaving quickly.
 3. **Average Session Duration:** Tracks how long users stay on the website.
 4. **Keyword Rankings:** Shows position of target keywords on search results.
 5. **Click-Through Rate (CTR):** Reflects how attractive your titles/meta descriptions are.
 6. **Backlinks:** Signals authority; more quality backlinks improve SEO rankings.
-

42. What is meant by domain authority in SEO?

- **Domain Authority (DA)** is a score (0–100) that predicts how well a website will rank on search engines.
- A **higher DA** suggests a site is trusted, authoritative, and more likely to appear higher in search results.
- It is calculated based on factors like number of backlinks, content quality, and site trustworthiness.
- **Example:** A site like Wikipedia has DA above 90, making it dominate search results.

- Though not a Google metric, DA is widely used in SEO tools like Moz to benchmark sites.

43. Differences between on-page and off-page SEO.

Aspect	On-Page SEO	Off-Page SEO
Definition	Optimization done within the website itself	Optimization done outside the website
Focus	Content, HTML, and internal site structure	Backlinks, social signals, domain reputation
Control	Fully under webmaster's control	Influenced by others (e.g., backlinks from other sites)
Example	Adding meta tags, keyword-rich content, image alt text	Building links via guest posts or influencer mentions
Goal	Improve relevance and usability	Improve trust and authority of the site

44. Define user segmentation and give one example.

- **User segmentation** is dividing website visitors into distinct groups based on shared traits or behaviors.
- Helps deliver personalized content, offers, and user experiences.
- Segments may be based on demographics, location, behavior, or device used.
- **Example:** Showing different product recommendations for frequent buyers vs. first-time visitors.
- It improves targeting and increases chances of conversion or engagement.

45. Write the purpose of funnel analysis in tracking user behaviour.

- **Funnel analysis** visualizes the sequence of steps users take to complete a goal (like a purchase).
- Identifies where users drop off and helps optimize those specific steps.
- Helps marketers understand what's stopping users from converting.

- Allows A/B testing to improve key stages (like sign-up or payment).
 - **Example:** A 4-step funnel showing 70% drop-off at the “Add to Cart” stage may indicate friction in that flow.
-

46. Identify 4 tools used for keyword research and their unique feature.

Tool	Unique Feature
Google Keyword Planner	Shows official search volume and competition (free tool by Google).
Ubersuggest	Offers keyword suggestions + SEO difficulty and trend charts.
SEMrush	Tracks keywords for both your site and competitors with historical data.
Ahrefs	Strong in backlink + keyword analysis with SERP overview and keyword gap features.

47. Importance of behavioural segmentation in digital marketing.

- **Behavioral segmentation** groups users based on actions like clicks, purchases, or time spent.
 - Helps in delivering more relevant content, ads, and offers.
 - Increases ROI by targeting the right users with the right messages.
 - Enables re-engagement of users based on behavior (e.g., cart abandoners).
 - **Example:** A travel site showing hotel discounts only to users who recently searched for “Goa packages”.
-

48. Explain how technical SEO affects a website’s ranking on search engines.

- Ensures the website is **crawlable and indexable** by search engines.
- Includes site speed, mobile responsiveness, secure HTTPS protocol.
- Fixes issues like broken links, duplicate content, and XML sitemaps.
- Helps improve overall user experience and site health, impacting rankings.
- **Example:** A site with slow load time may rank lower even if it has quality content.

49. Discuss the process of optimizing web content using keyword research.

- **Step 1 – Research Keywords:** Use tools to find relevant, high-search, low-competition keywords.
- **Step 2 – Organize Content:** Structure articles or product pages around target keywords.
- **Step 3 – Keyword Placement:** Naturally place keywords in titles, headings, URLs, and body text.
- **Step 4 – Improve Readability:** Avoid overstuffing; maintain flow and user focus.
- **Example:** A page targeting “best phones under ₹20,000” should use the keyword in H1, intro, and meta tags.

50. Analyze the effectiveness of backlinks and bounce rate in evaluating SEO performance.

- **Backlinks** reflect your site’s authority — more quality backlinks mean higher trust and rankings.
- **Bounce Rate** shows whether visitors are engaging with your content or leaving quickly.
- Together, they indicate **SEO quality and user satisfaction**.
- **Example:** A blog with strong backlinks but a 90% bounce rate may be ranking well but failing to retain visitors.
- SEO is not only about traffic — it’s about traffic that stays and converts.

51. Role of funnel visualization in mapping user journeys on a website.

- Funnel visualization shows step-by-step how users move from entry to goal completion.
- Helps pinpoint **exact stages** where users drop off (e.g., “Add to Cart” → “Checkout”).
- Encourages **UX and conversion improvements** by focusing on problem areas.
- Supports A/B testing to test which funnel design performs better.
- **Example:** If most users abandon the funnel at the login stage, a guest checkout option might help.
